

HOW DO I HELP A BIRD IF IT STRIKES MY WINDOW?

First, call Greenwood at 303-823-8455.

If Greenwood is not open, place the bird in a paper bag or a box with small breathing holes. Line the box with a t-shirt, pillowcase or paper towels. Make sure the bird is upright, and do not offer food or water.

Move the box indoors, away from predators, to a dark, warm, and quiet location. After an hour has passed, check the box to see if the bird is responsive. We recommend doing this outside in case the bird is ready to fly away. If it is still stunned, leave it in the box and call Greenwood at 303-823-8455. If you aren't in Colorado, use the Animal Help Now website (www.AHNow.org) or smartphone app to find a nearby wildlife rehabilitator. If you are not in the United States, do a web search for "wildlife rehabilitator" or "injured bird" to find whatever nearby assistance may be available.

Bird Window Strikes

GREENWOOD
WILDLIFE REHABILITATION CENTER

As many as one billion birds die each year in the United States from collisions with glass on residential and commercial buildings.

Cats, dogs, habitat loss, and climate change are also creating major problems for bird populations.

WHAT IS A WINDOW STRIKE?

Birds strike windows because they either mistake a reflection (usually in a window or door) for a safe flight path, or attack their own reflection in a misguided attempt to defend their territory.

Striking a window can cause birds to be stunned. They lie on their back, flutter, and in some cases the strike can be fatal.

The good news is there are ways to prevent these mishaps! If a bird does strike your window, Greenwood is here to help!

Call 303-823-8455 between 9AM – 4PM daily or visit our website:

EFFECTIVE STRATEGIES TO PREVENT WINDOW STRIKES

Internal modifications

Blinds and curtains can be used to eliminate the perception of flight paths. The best solution to “flight path windows” is to modify them with visual deterrents.

Feeder Placement

If you feed birds, make sure your windows are bird friendly. Place feeders within three feet of windows. From this distance, birds leaving feeders generally aren’t able to build up enough momentum to hurt themselves if they do fly into the glass.

External modifications to buildings

Apply visible markings to the outside of windows in patterns the birds can see. Most birds will avoid windows with vertical stripes spaced 4 inches apart or horizontal stripes spaced 2 inches apart. The stripes themselves should be at least 0.25 inches wide.

External modifications can be achieved in several ways:

- ✦ Window decals such as those offered by Window Alert (we sell these decals at our center in Lyons!).
- ✦ Vertical or horizontal lines made with weather-resistant pens or bird tape.
- ✦ Vertical parachute cords, strings of beads, or bamboo. Acopian BirdSavers are a commercially available option.
